

2-N

1. The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.

2. Next, you need to gather information. This can be done through interviews, observations, and reviewing relevant documents.

3. Once you have gathered the information, you need to analyze it. This involves looking for patterns, trends, and potential causes.

4. After analysis, you should develop a plan of action. This plan should outline the steps you will take to address the problem.

5. Finally, you need to implement the plan and monitor the results. This involves putting the plan into action and tracking progress over time.
